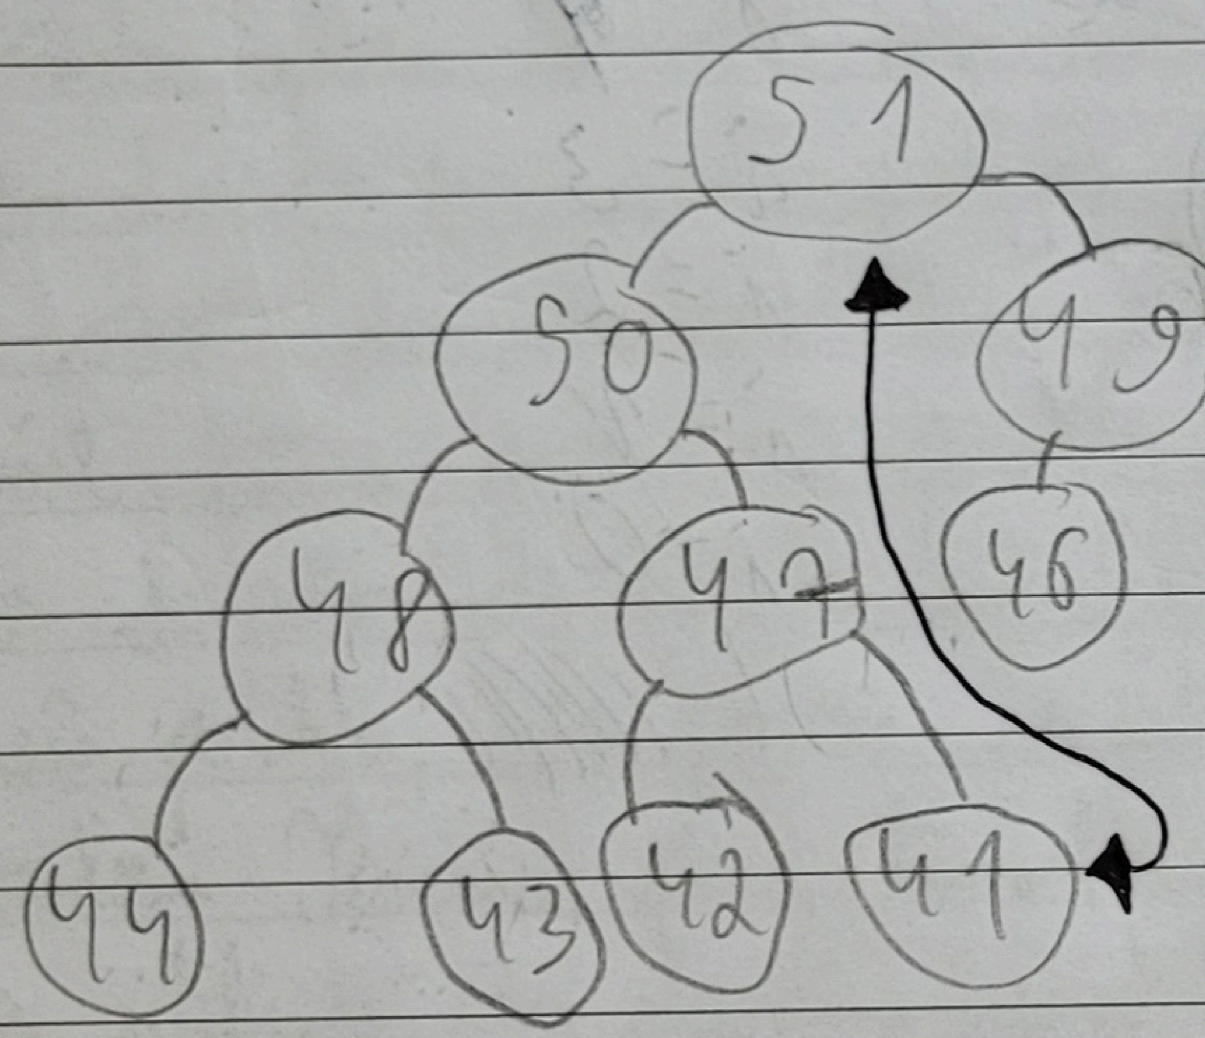
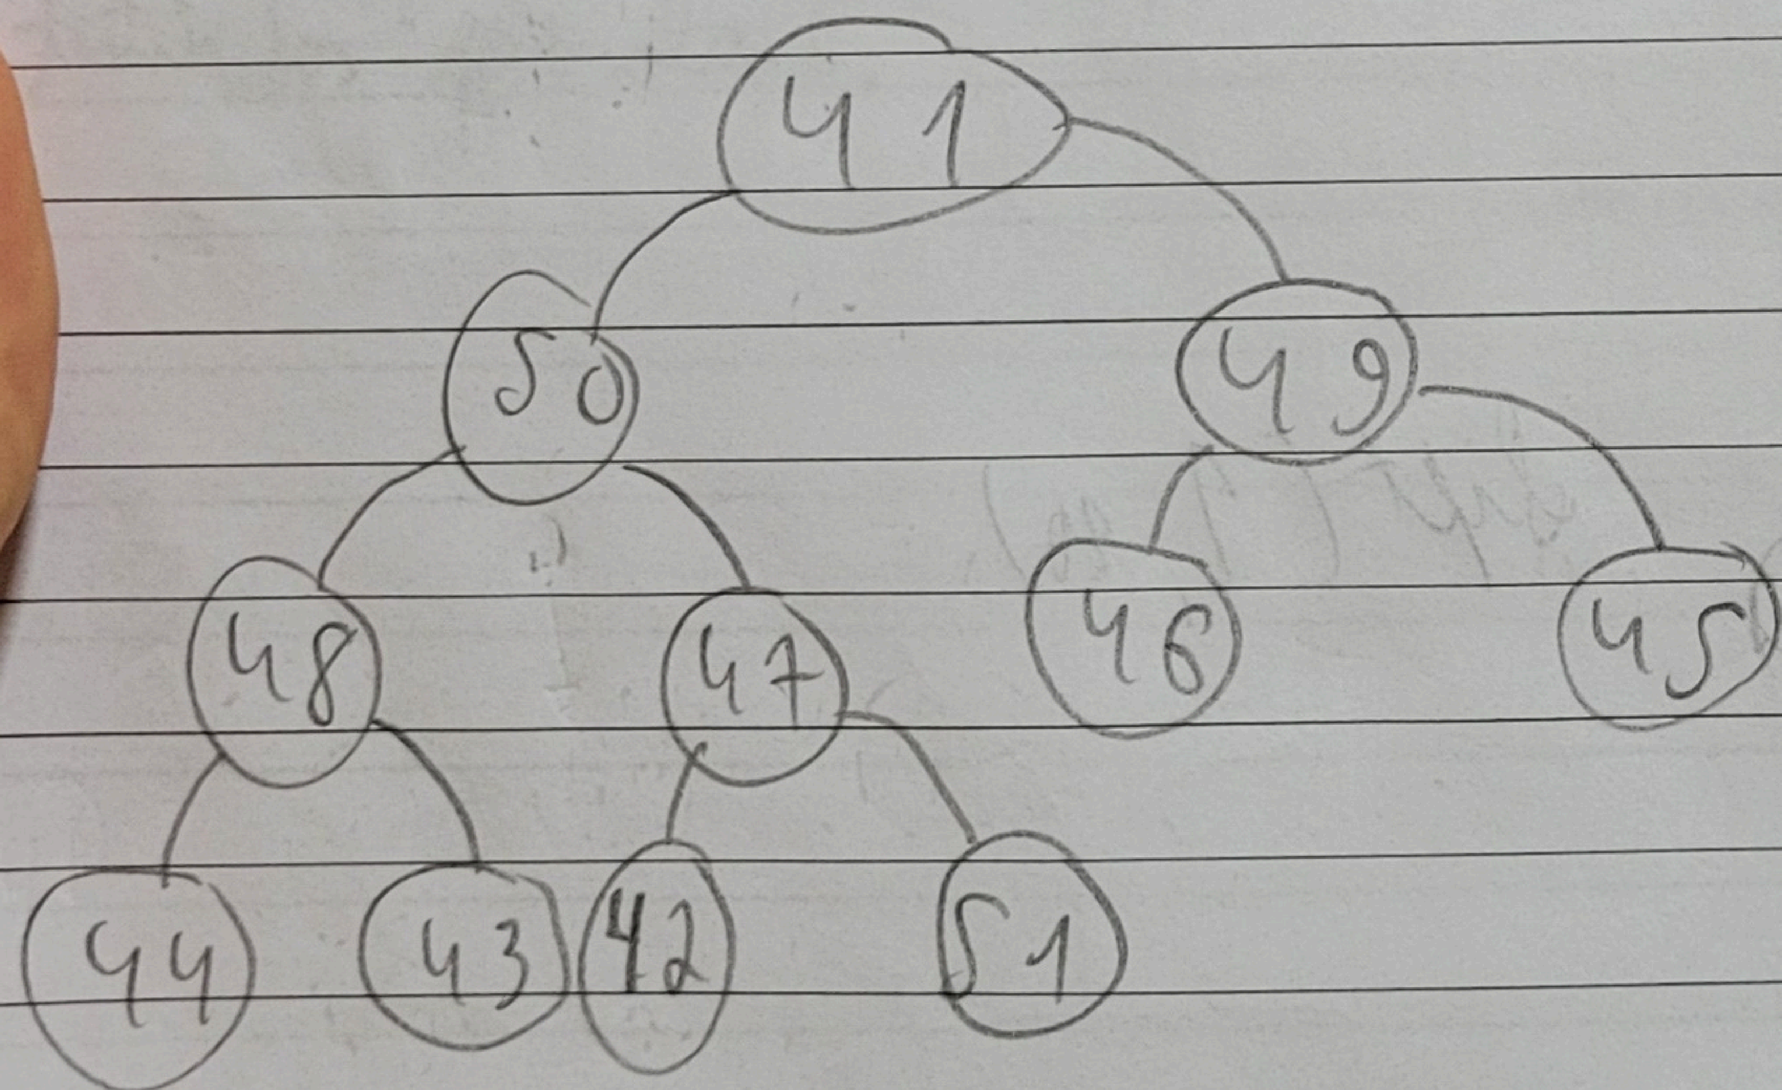
29.9.25

Simulação Heapsort

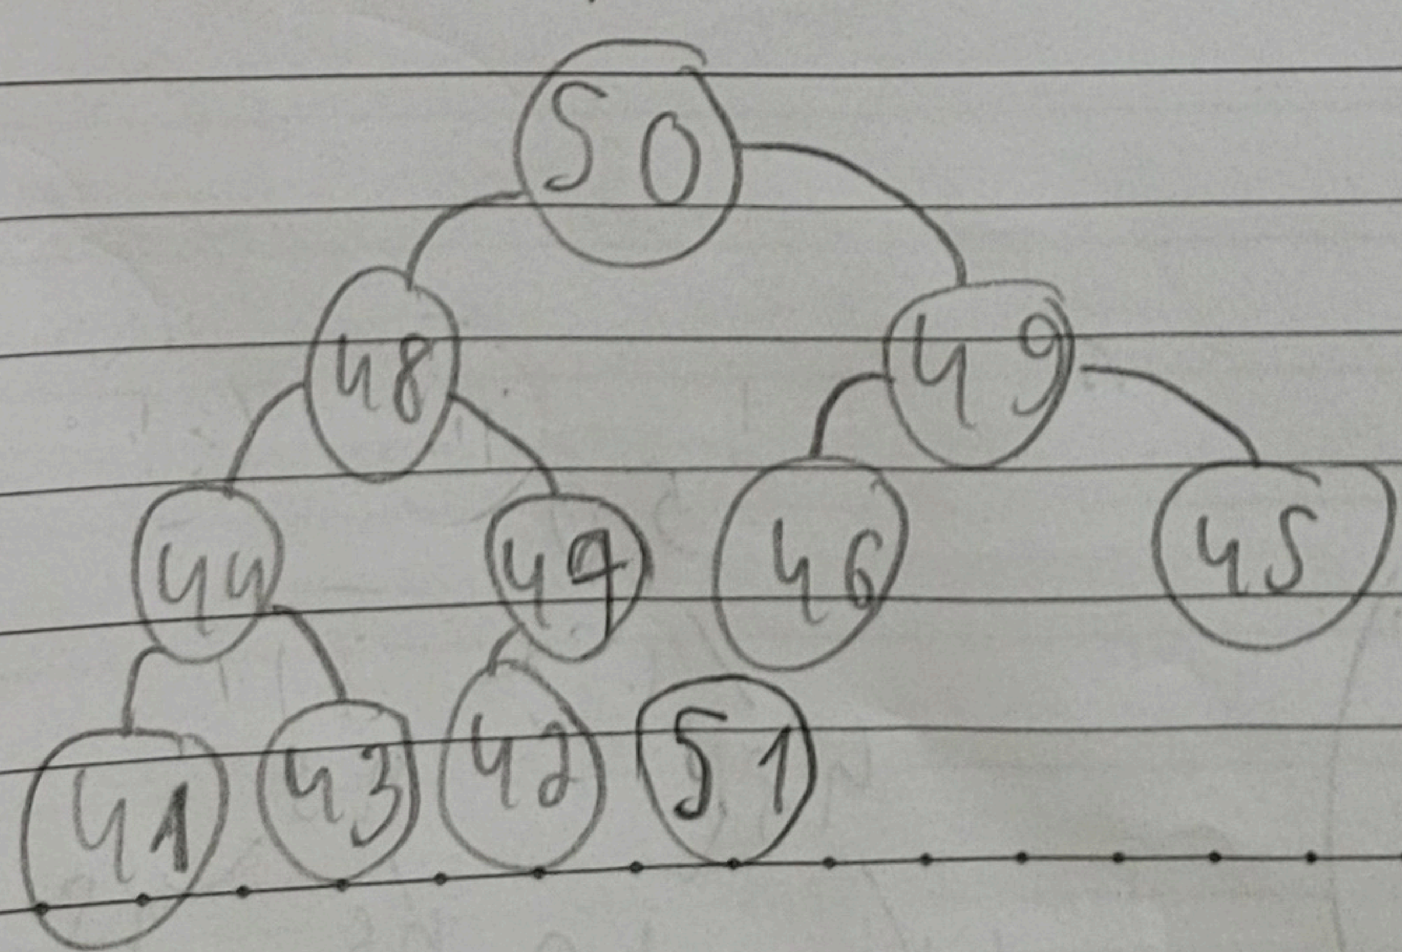
Vetor = [51, 50, 49, 48, 47, 46, 45, 44, 43, 42, 41]

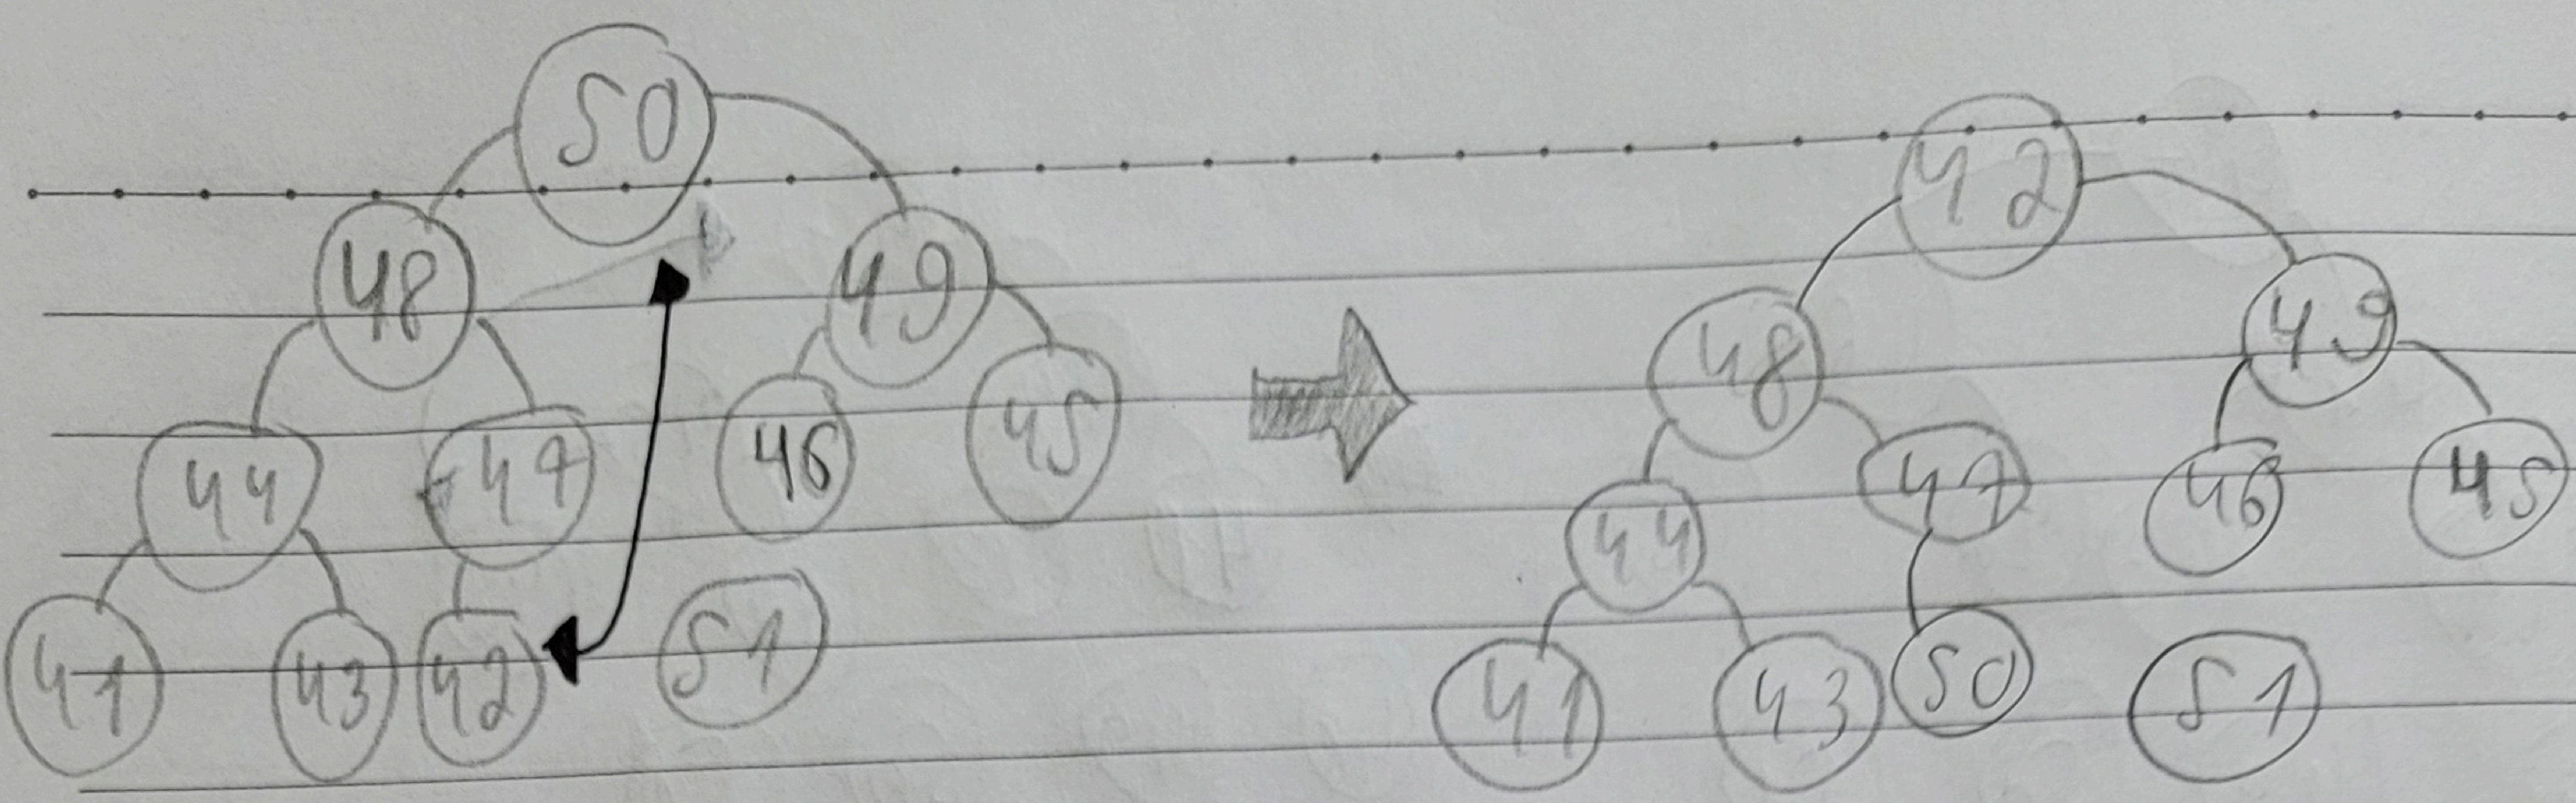
A função Build não mudará o vetor, pois o mesmo já está estruturado como um ~~Heap.~~ Heap.



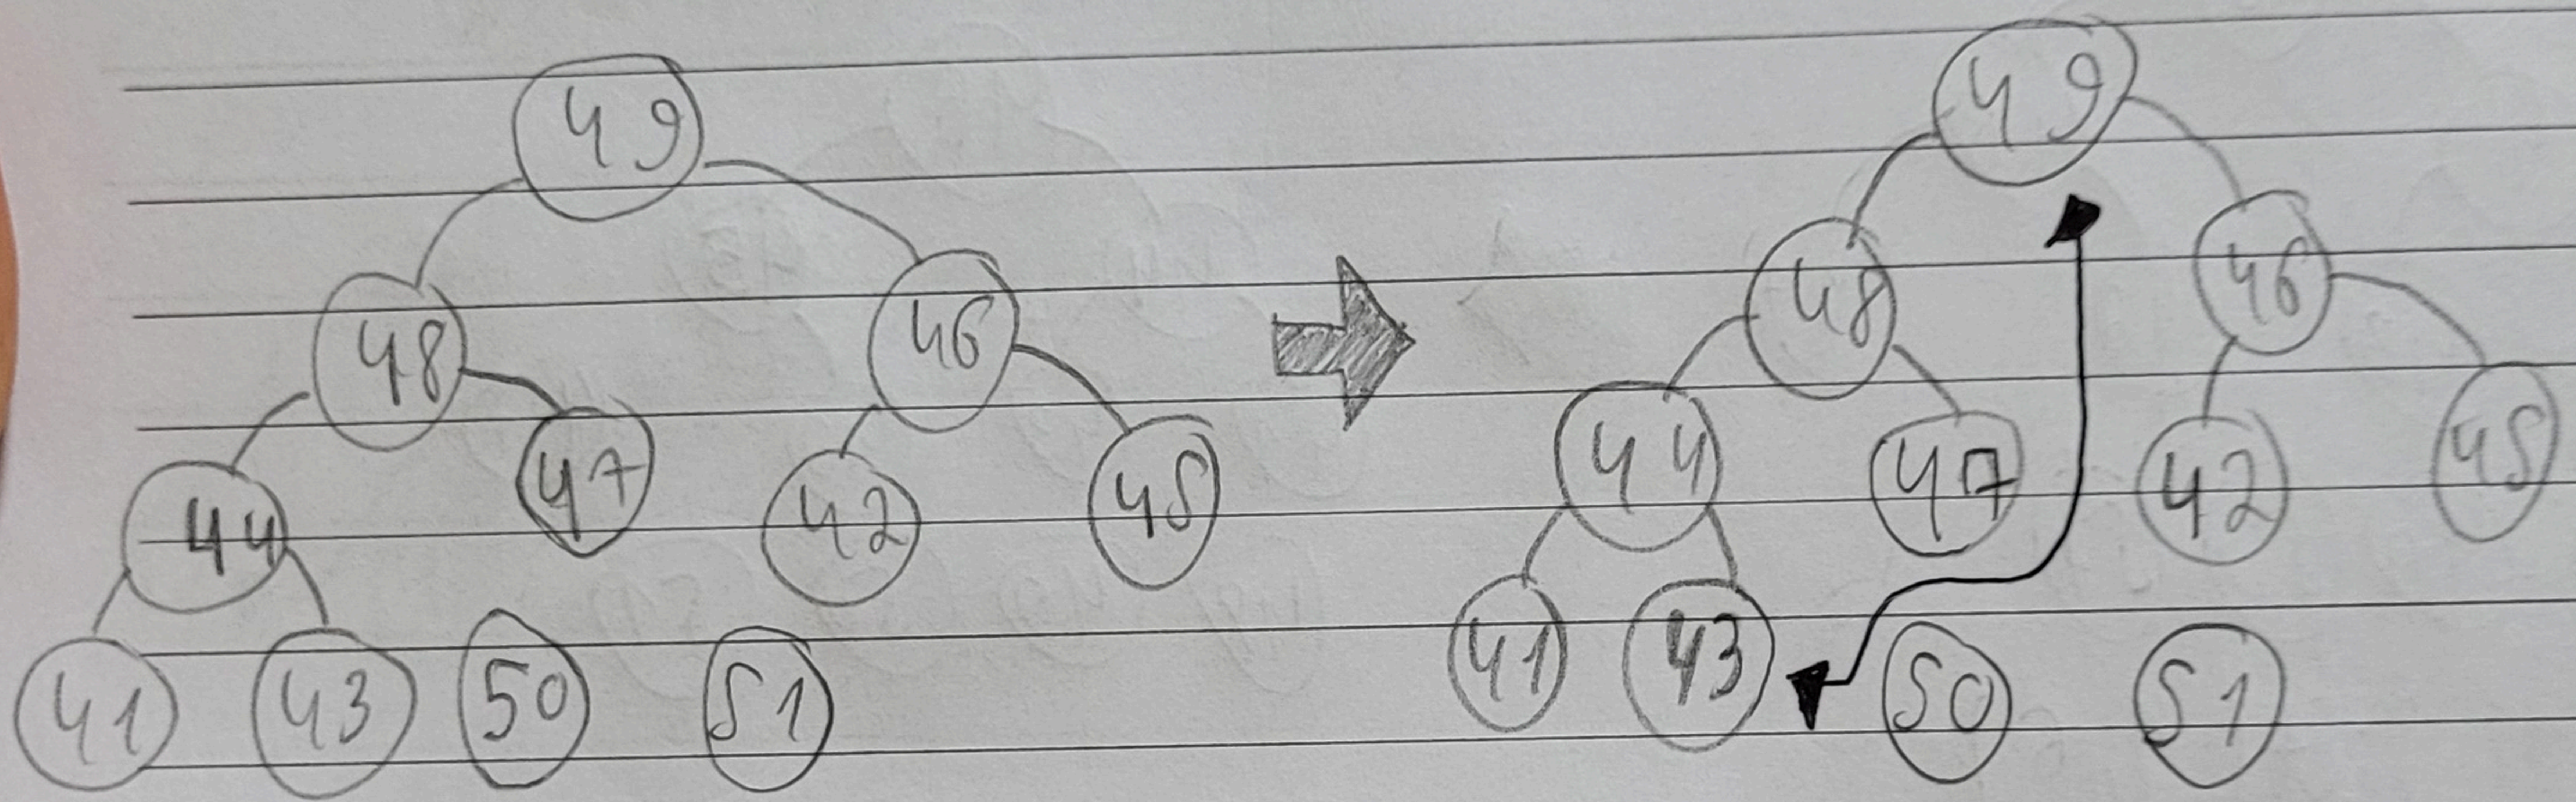


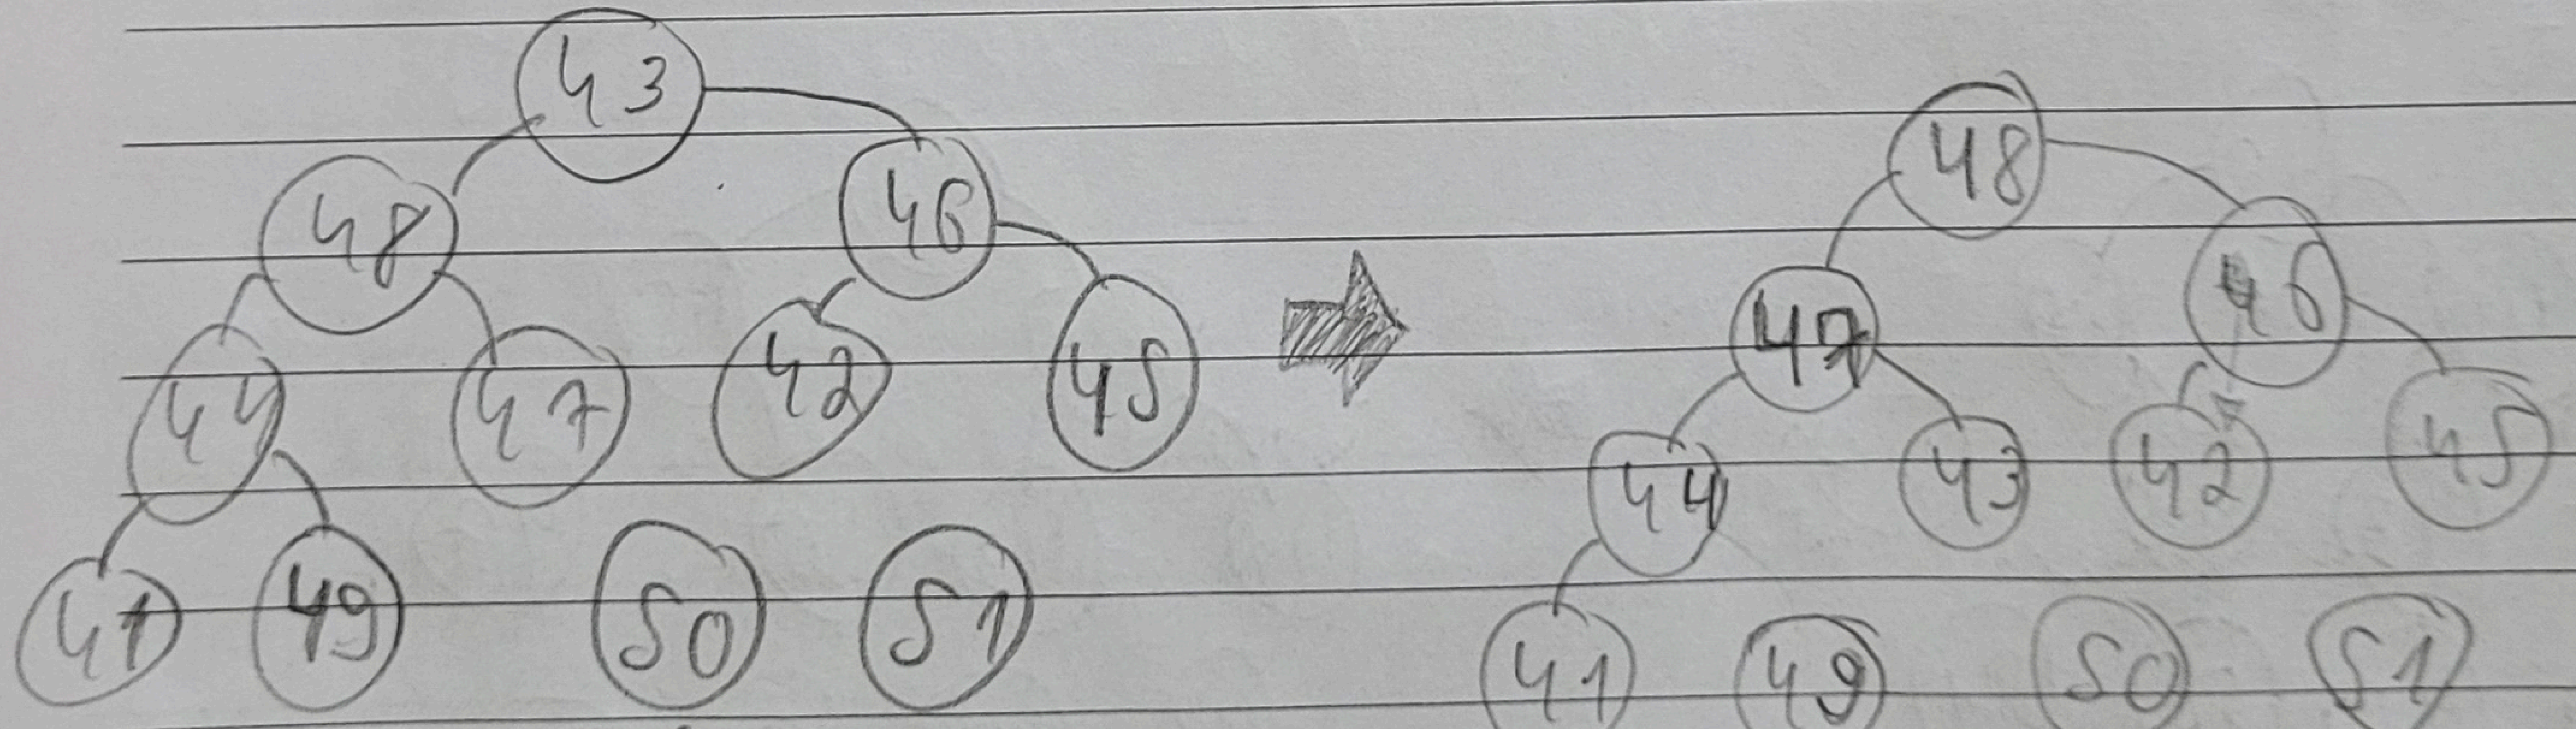
Sift (1, 10)



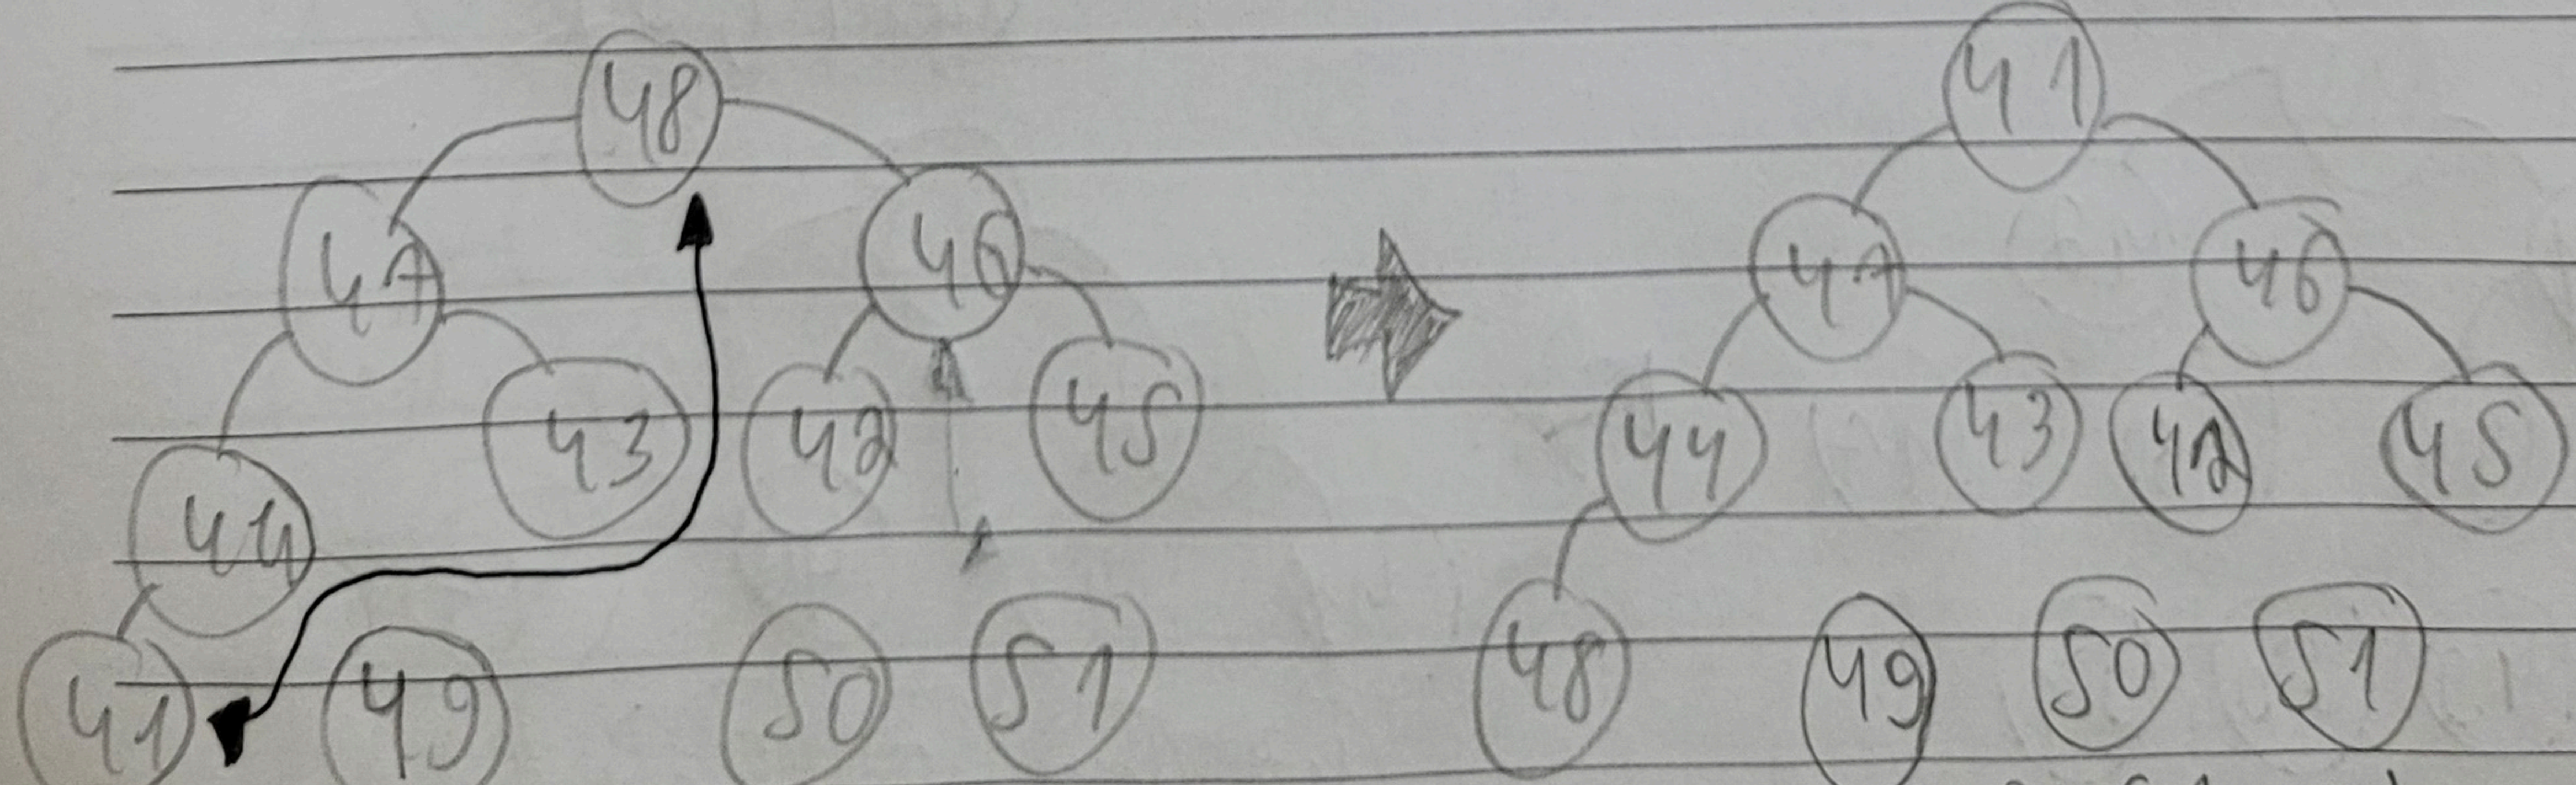


Sift(1, 9)

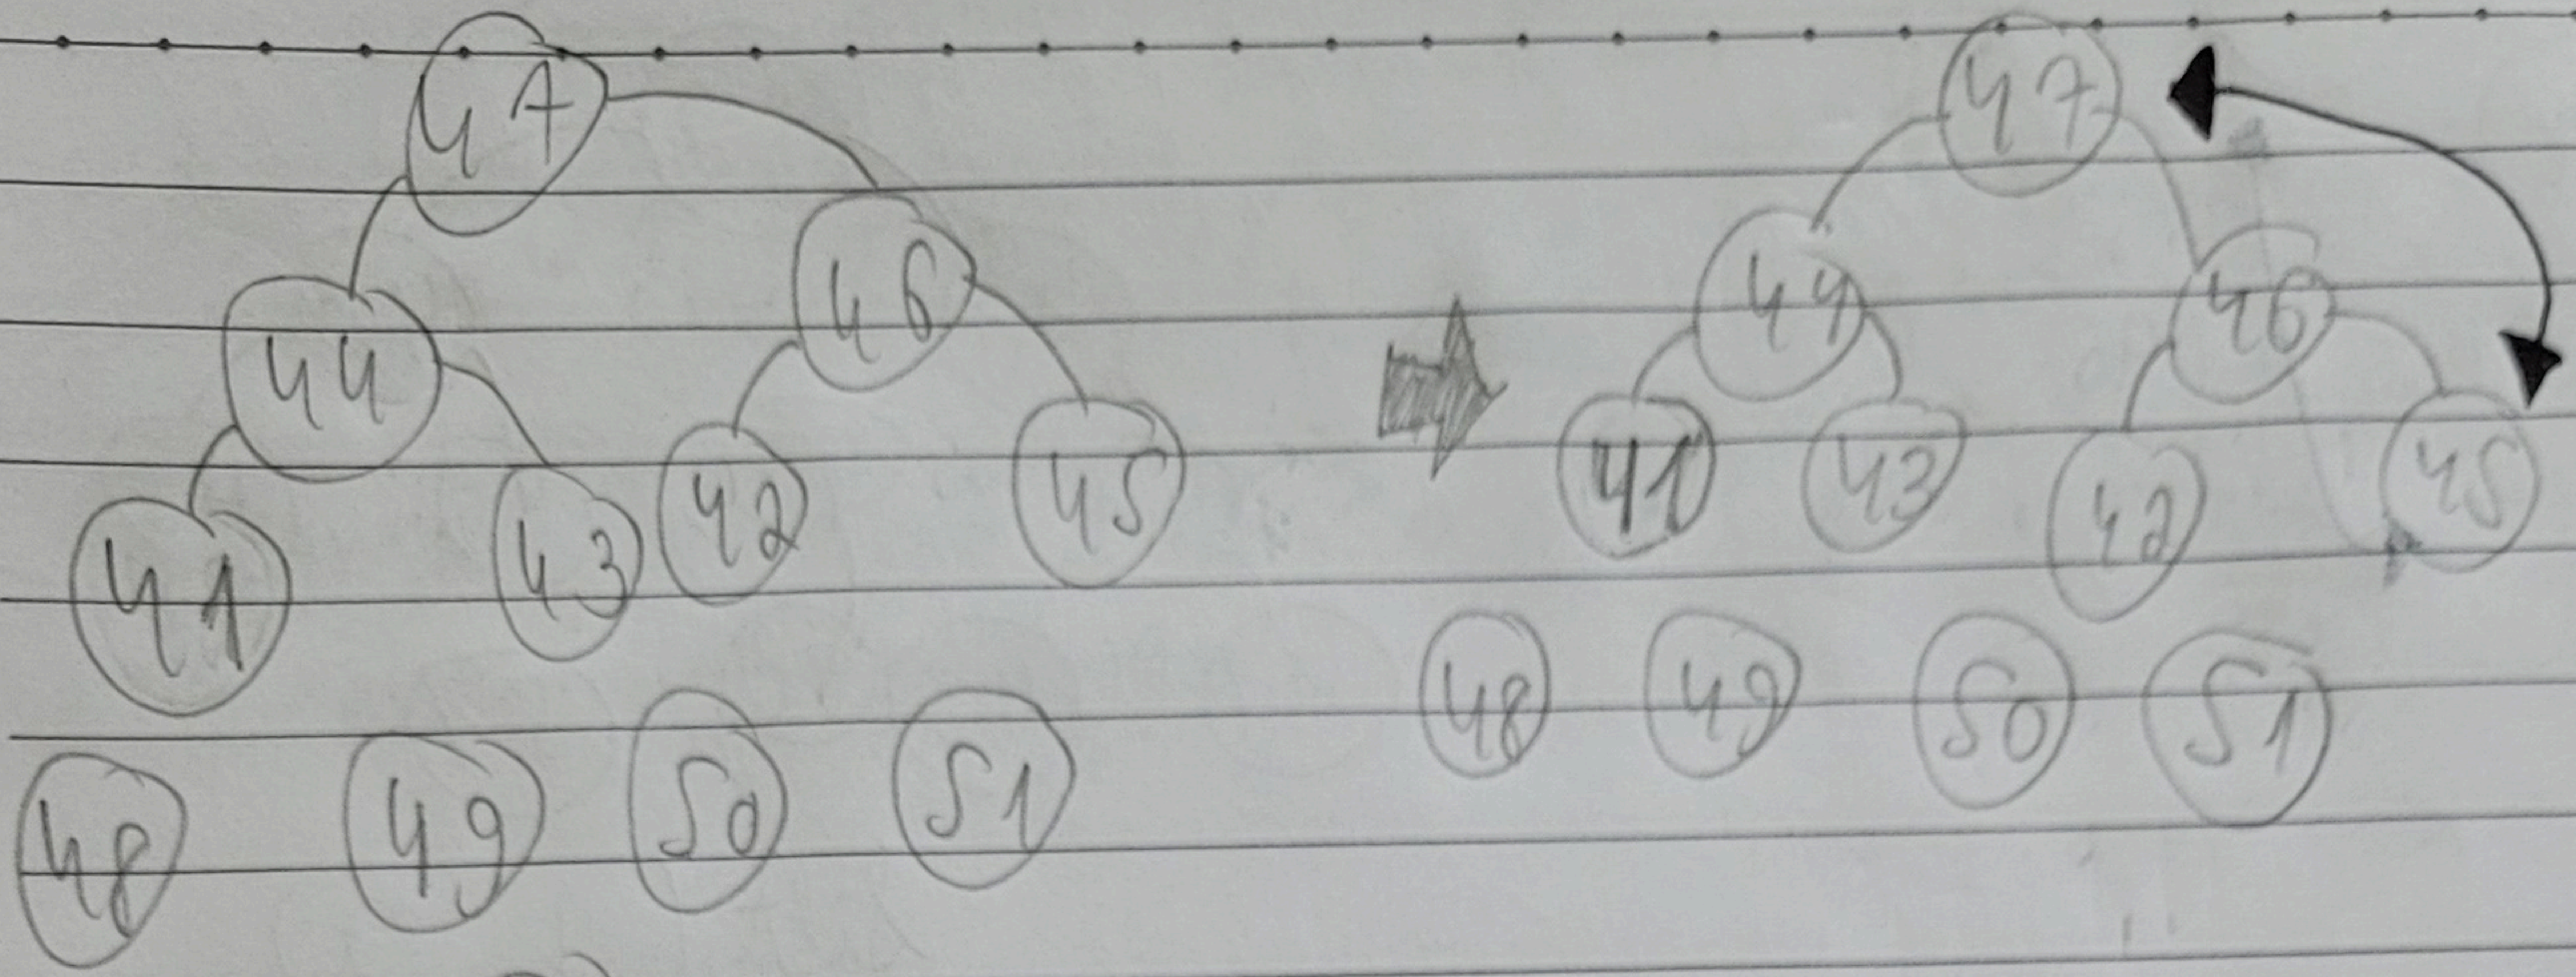


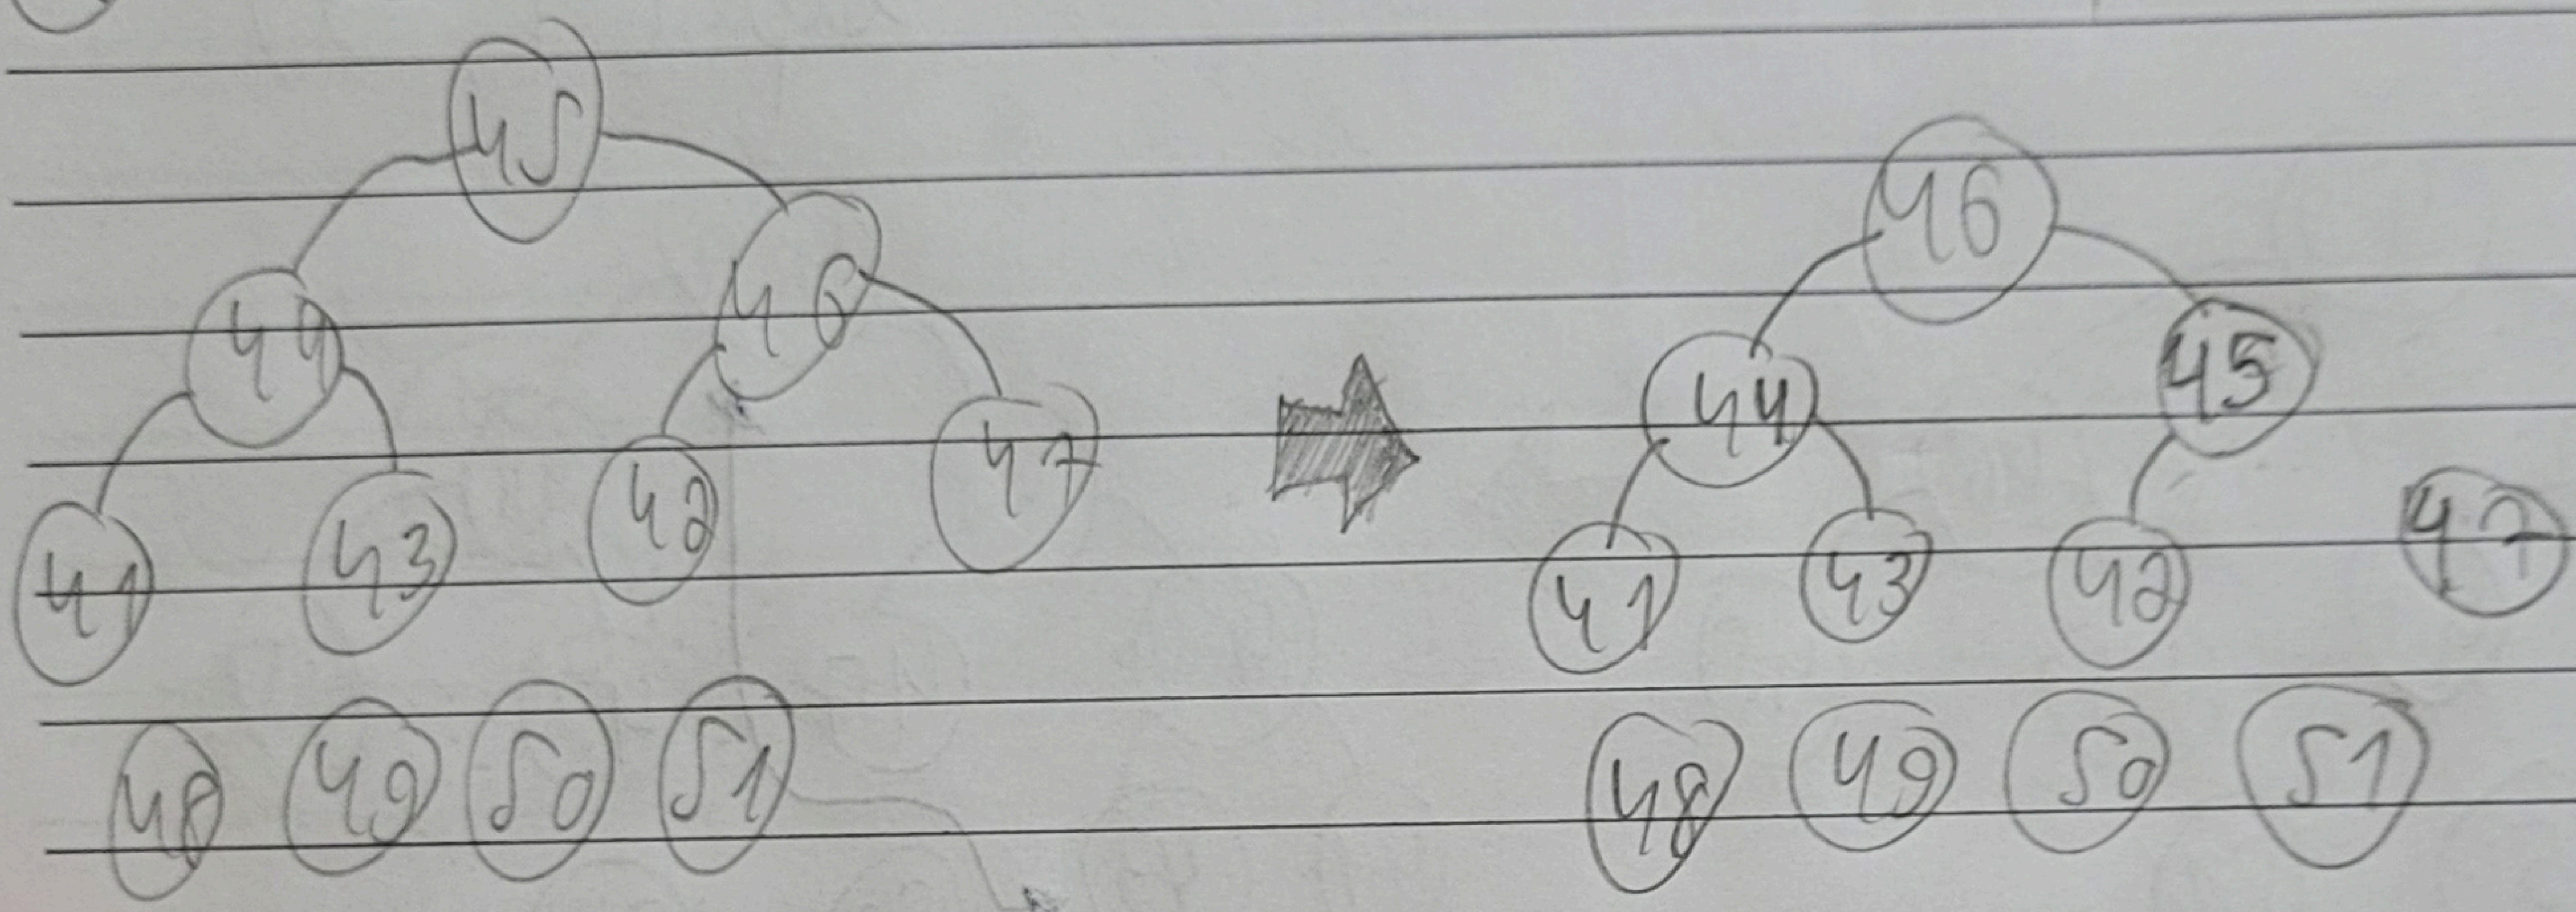


Sift(1, 8)

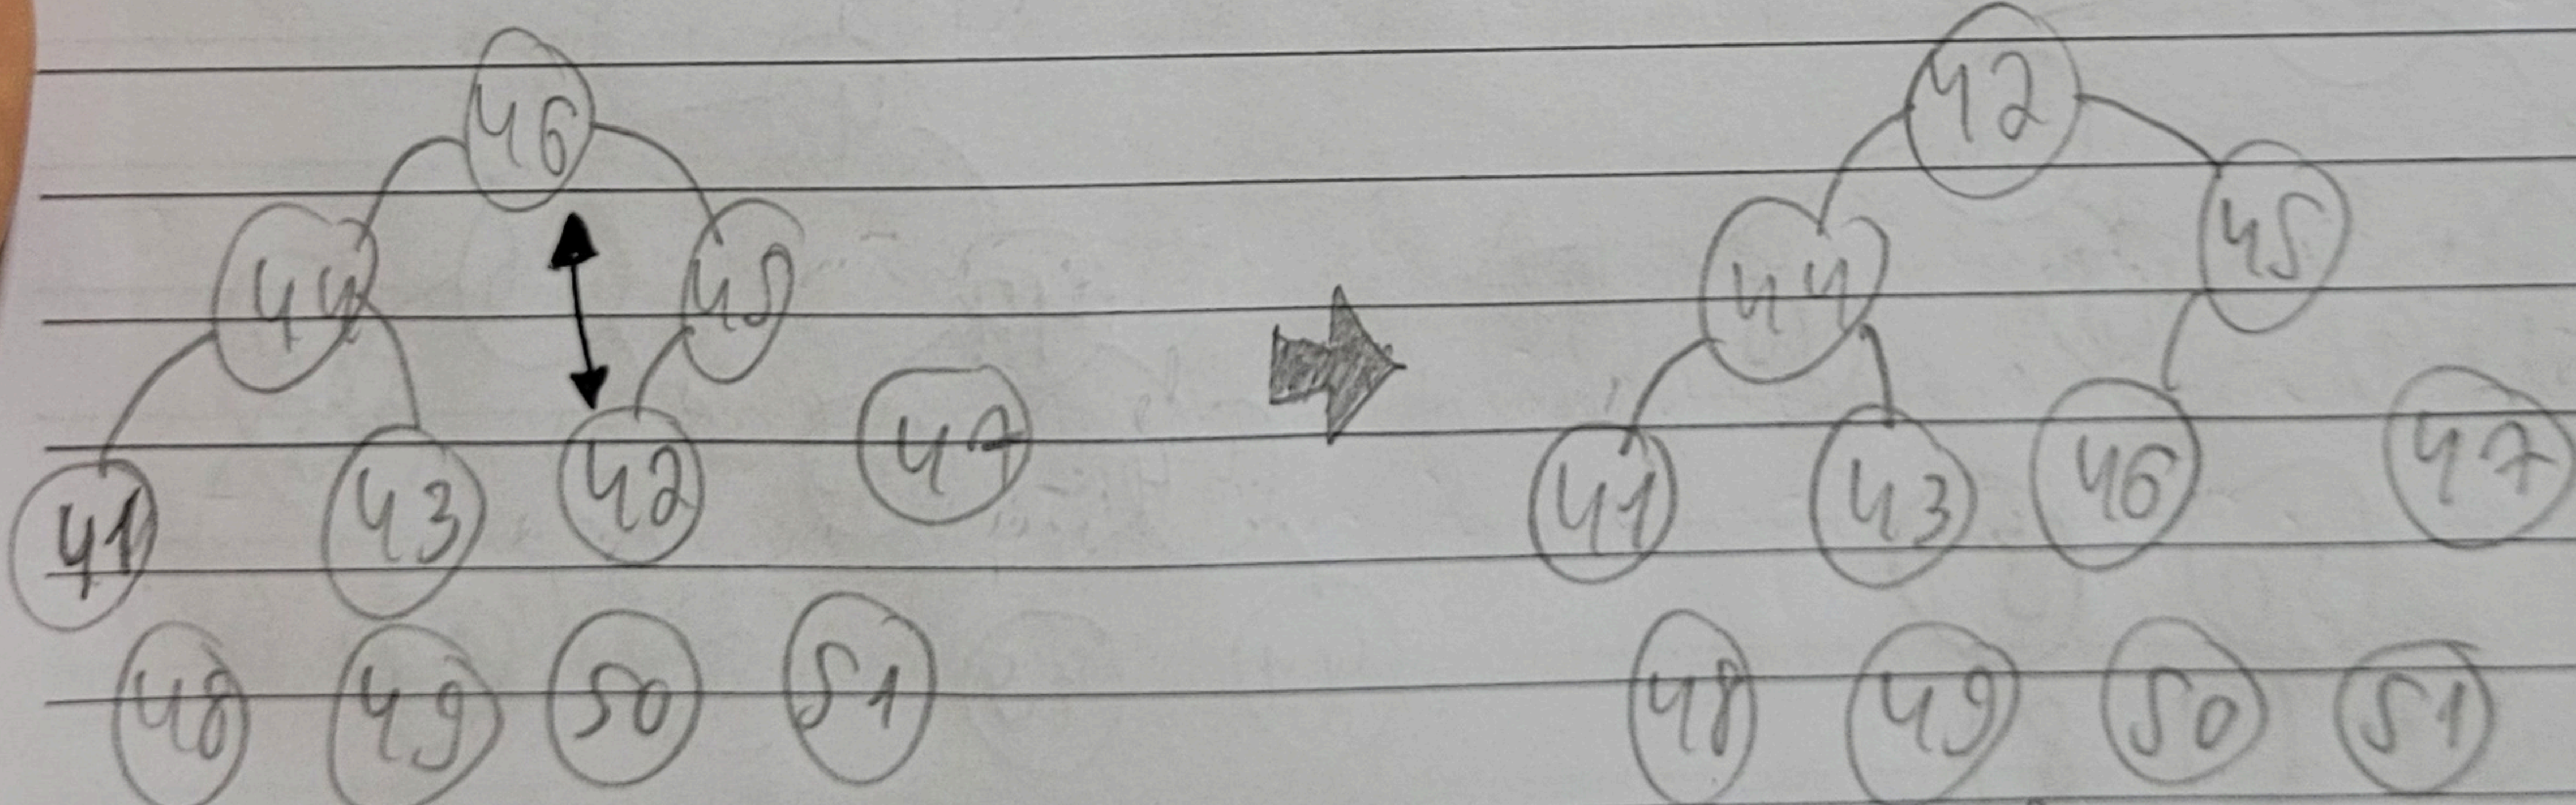


Sift(1, 7)

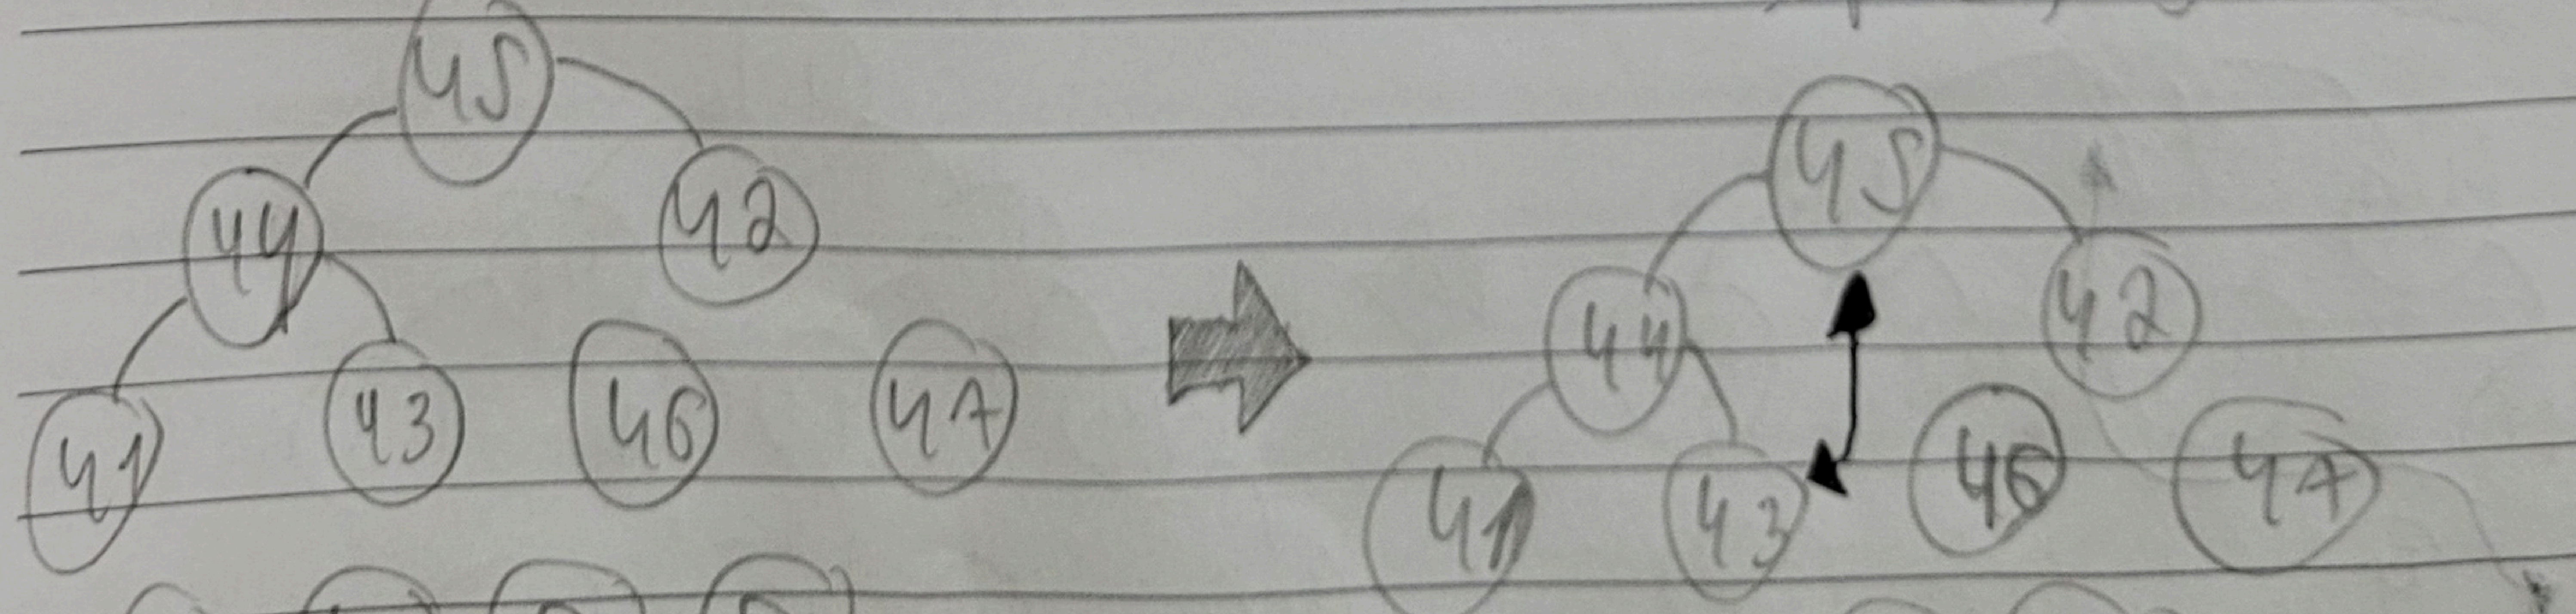


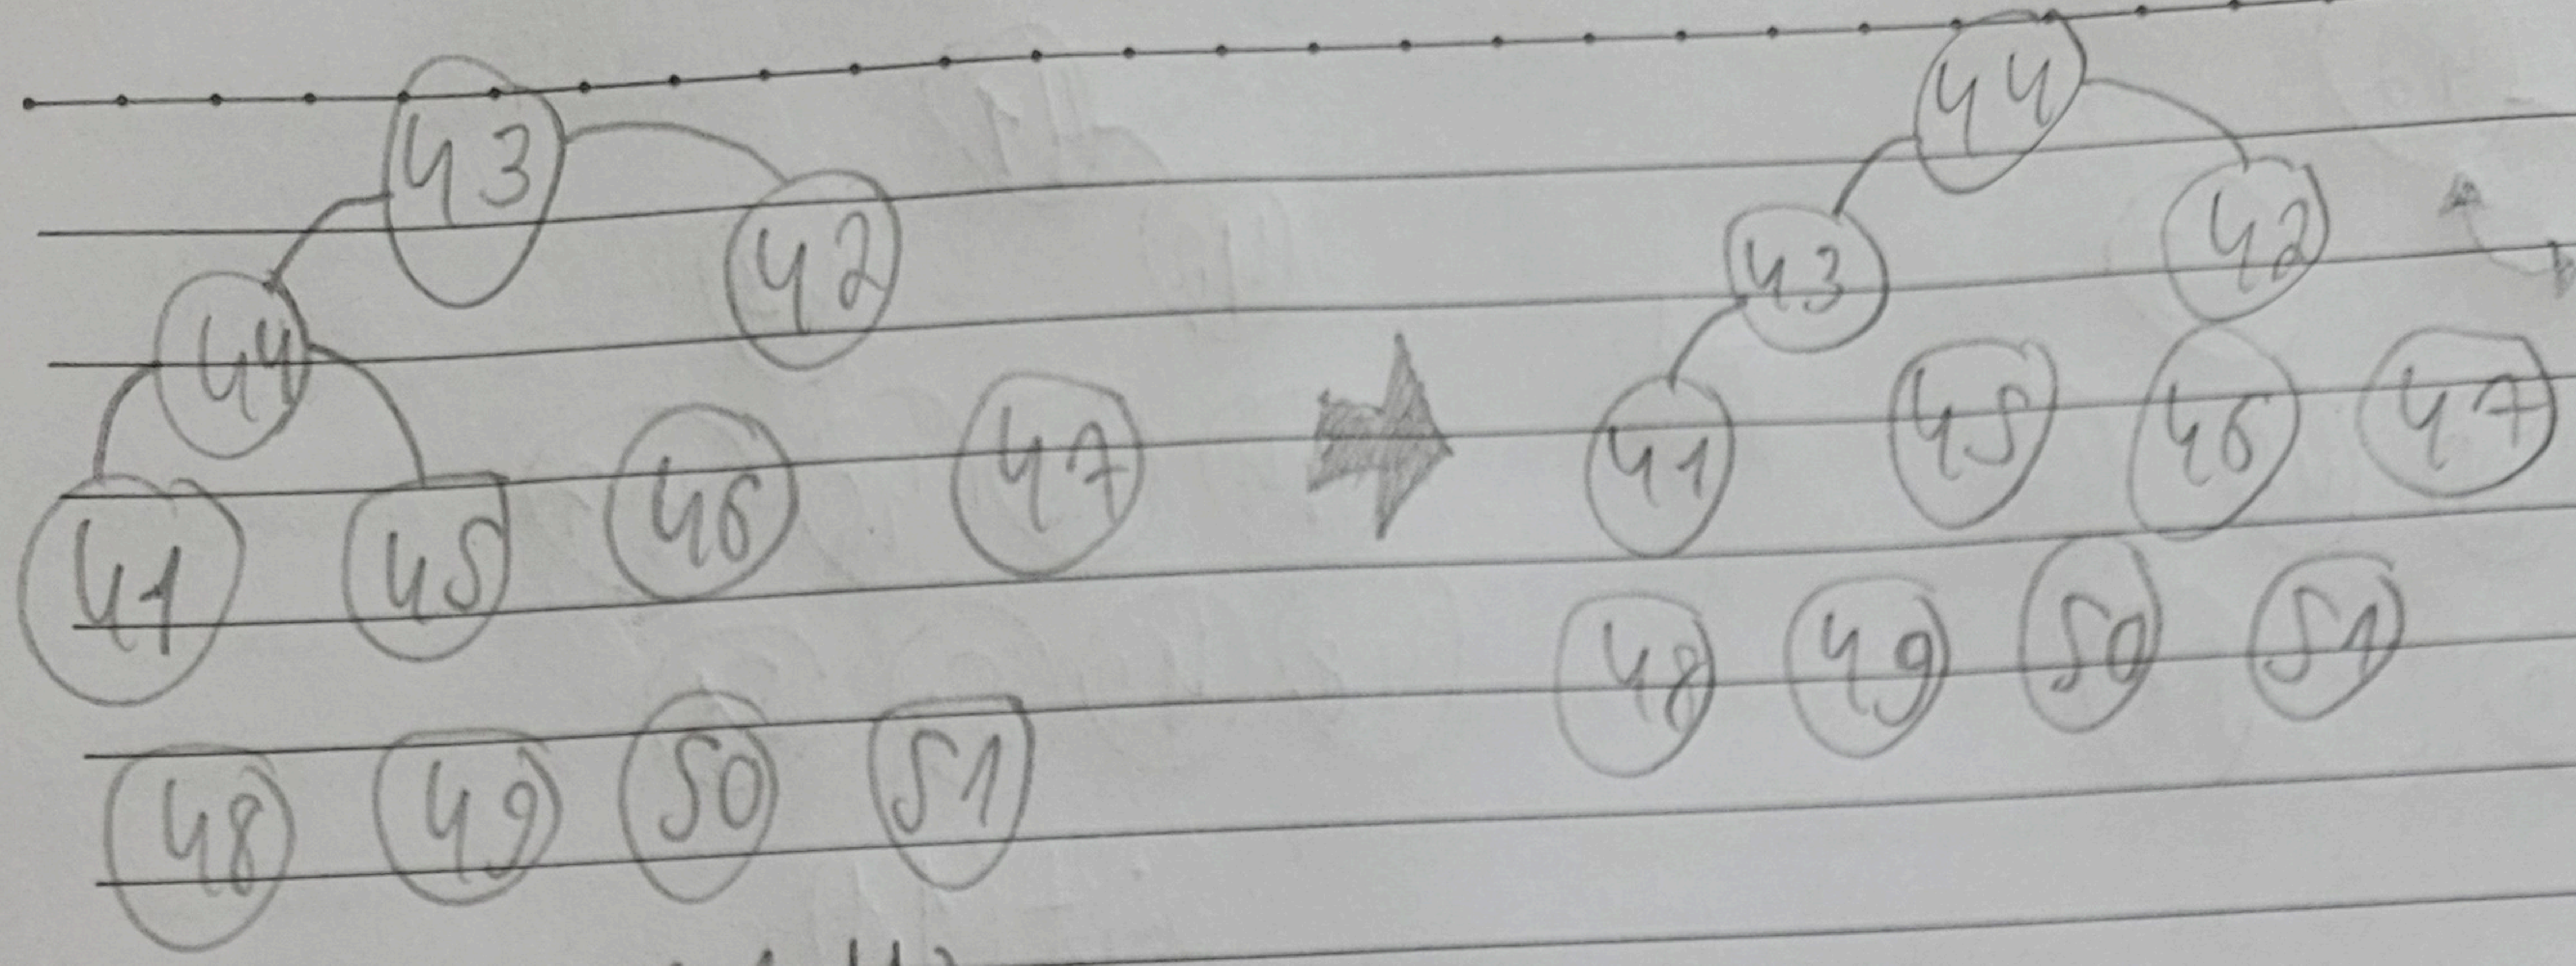


sift(1, 6)

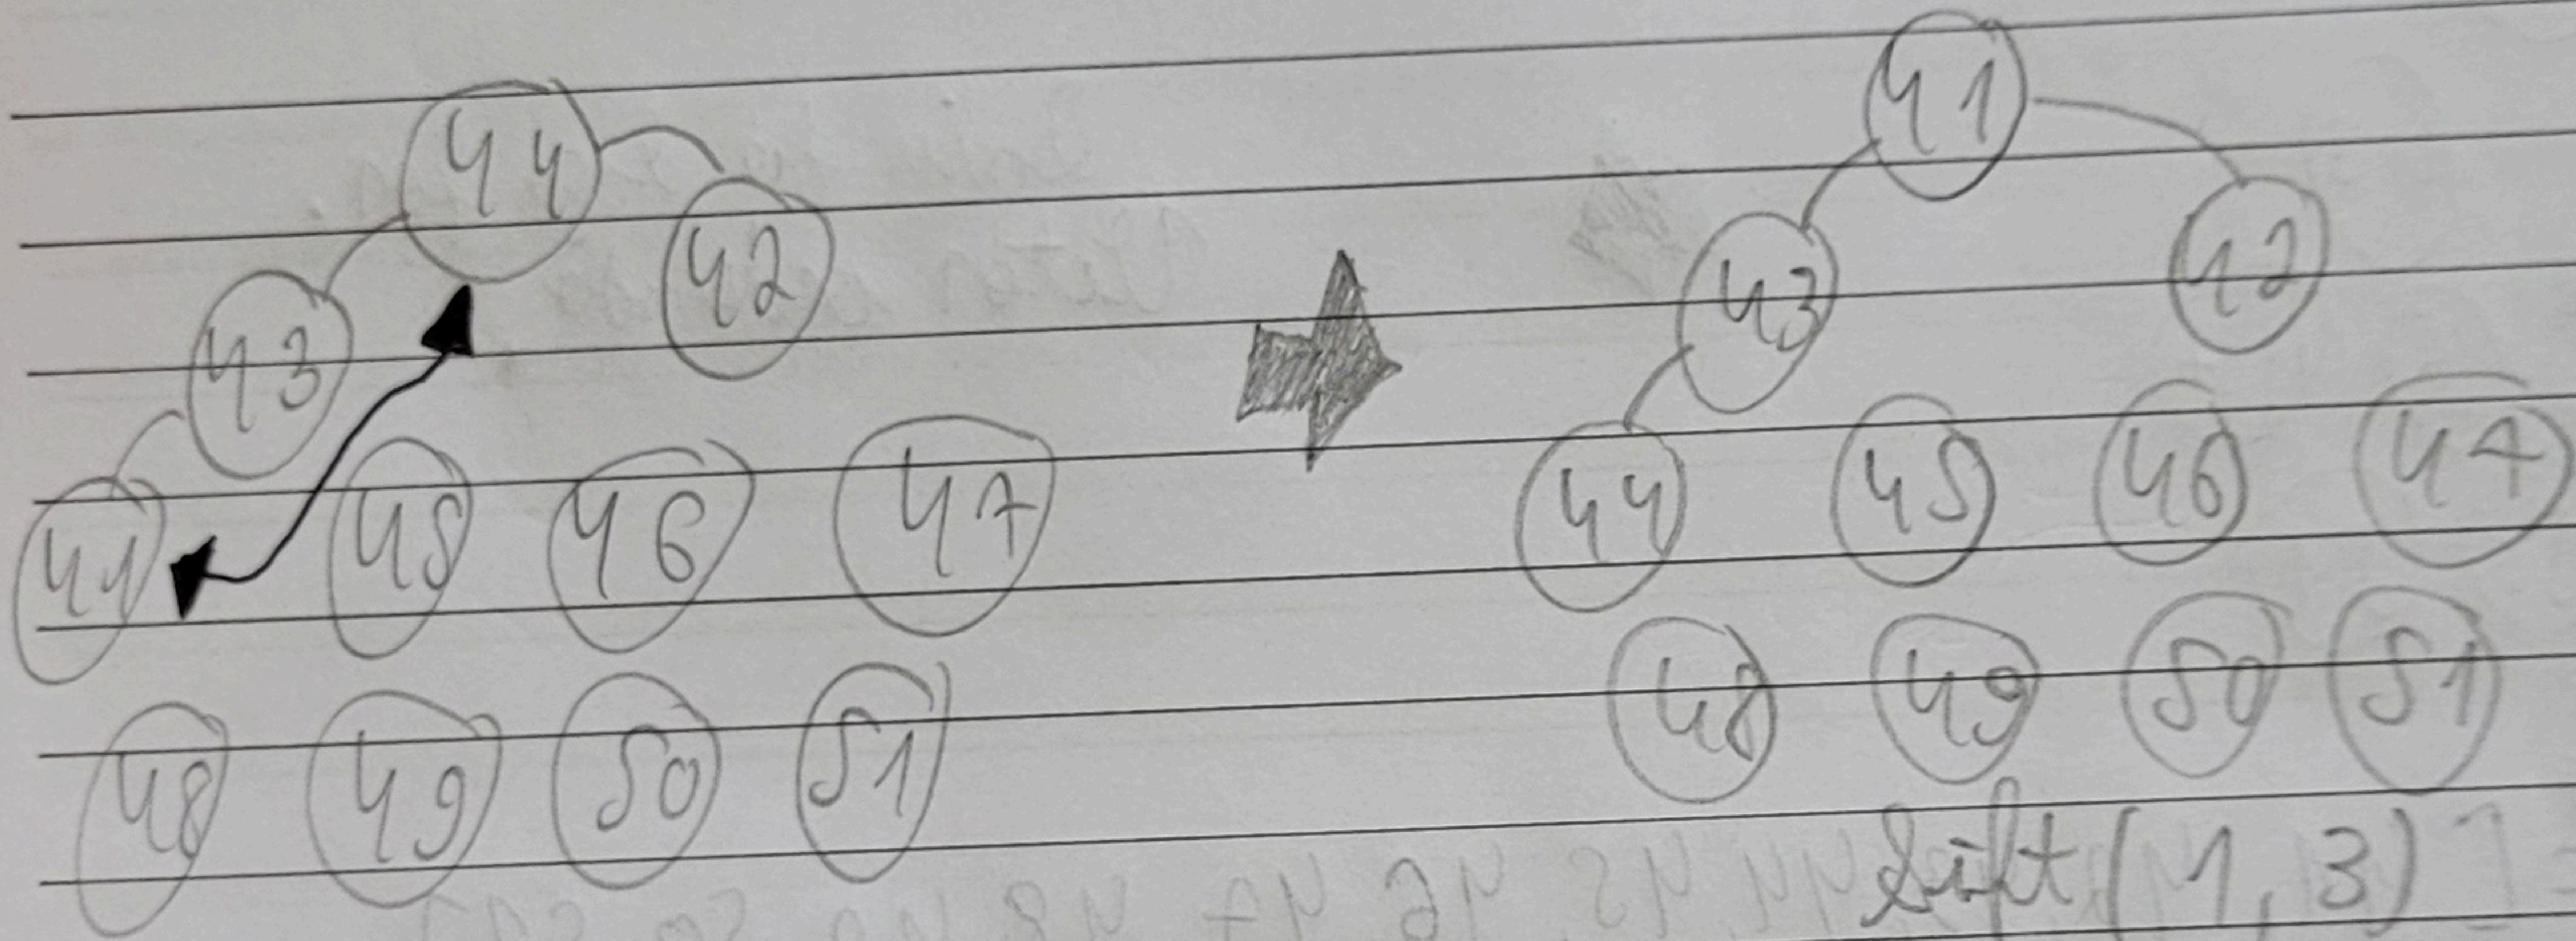


sift(1, 5)

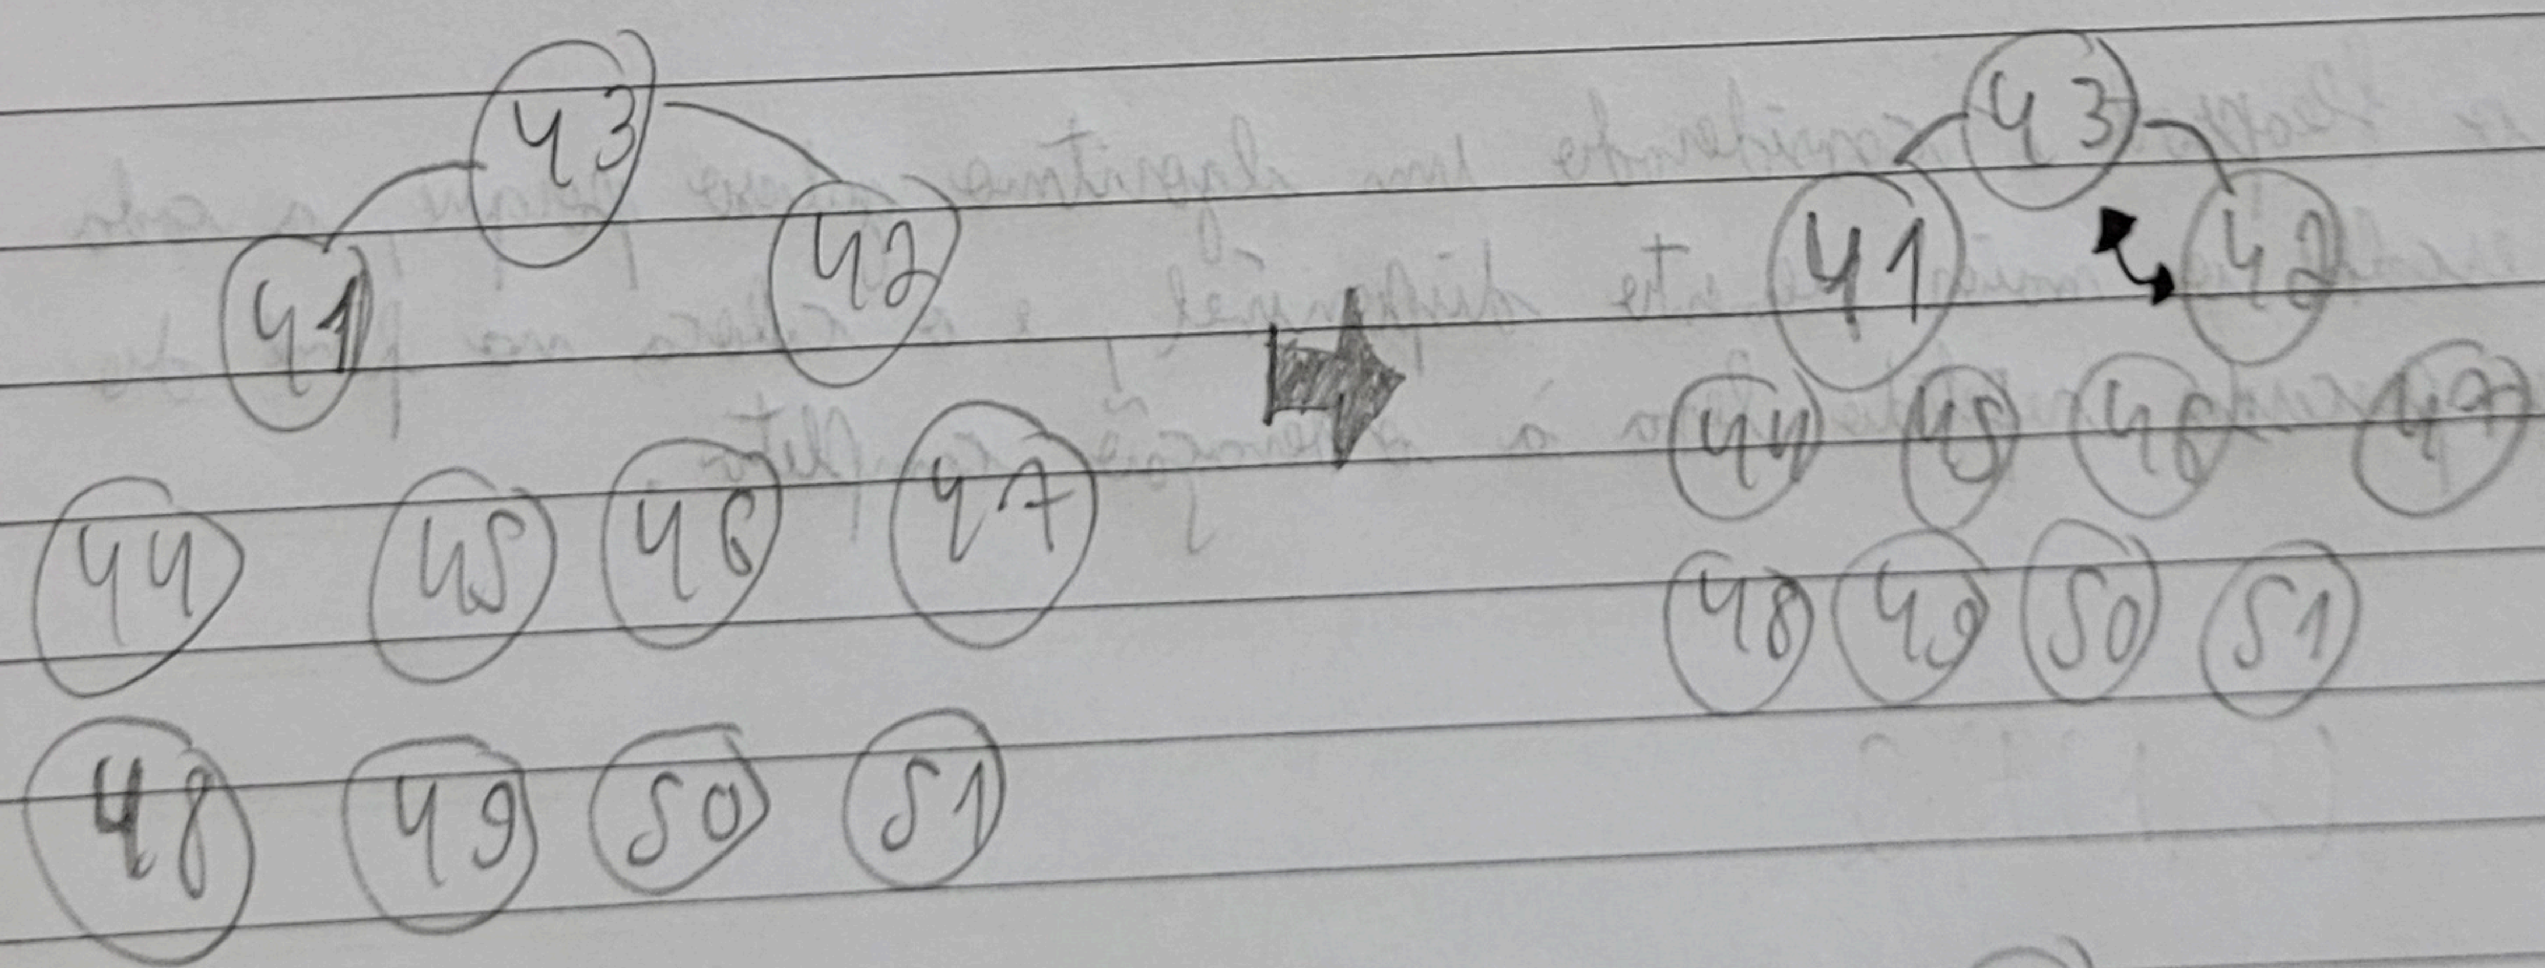


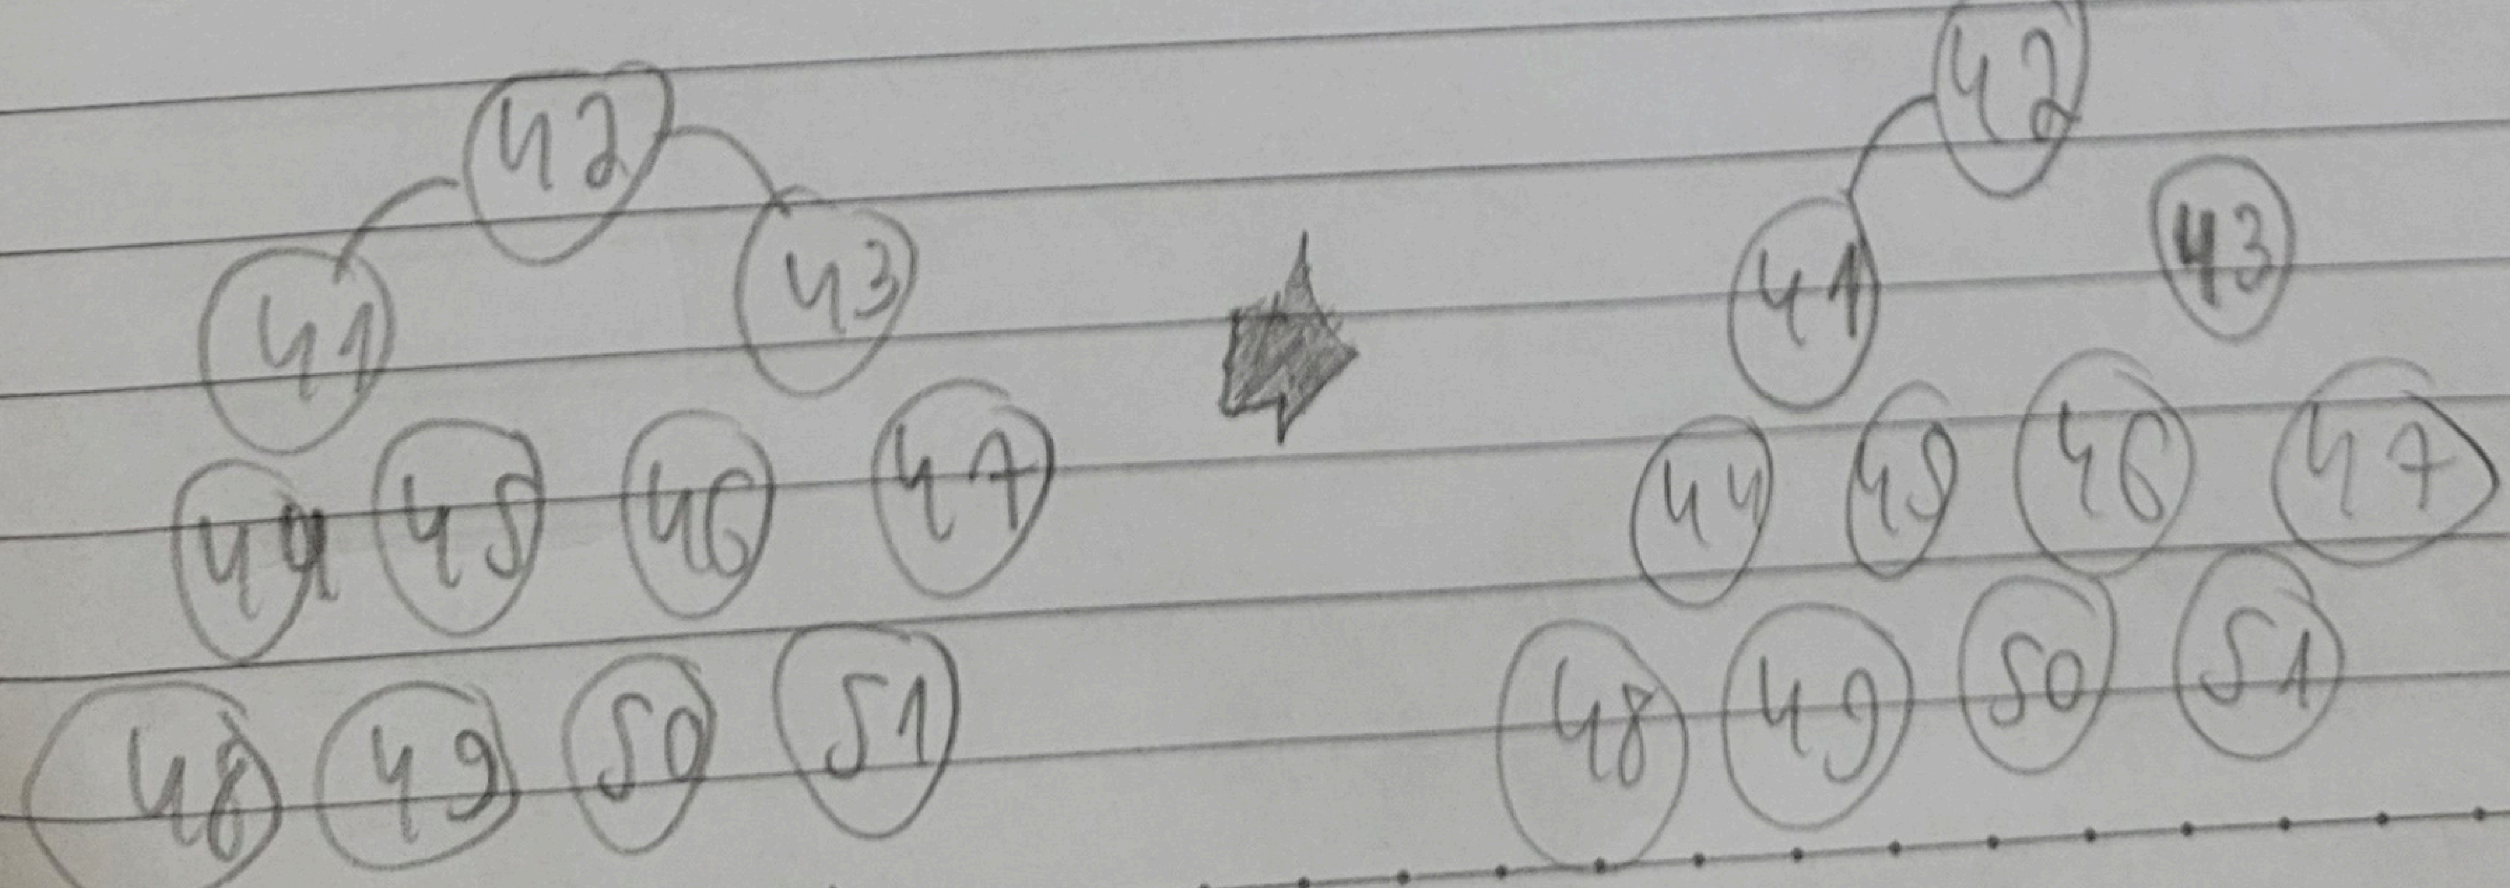


sift(1, 4)

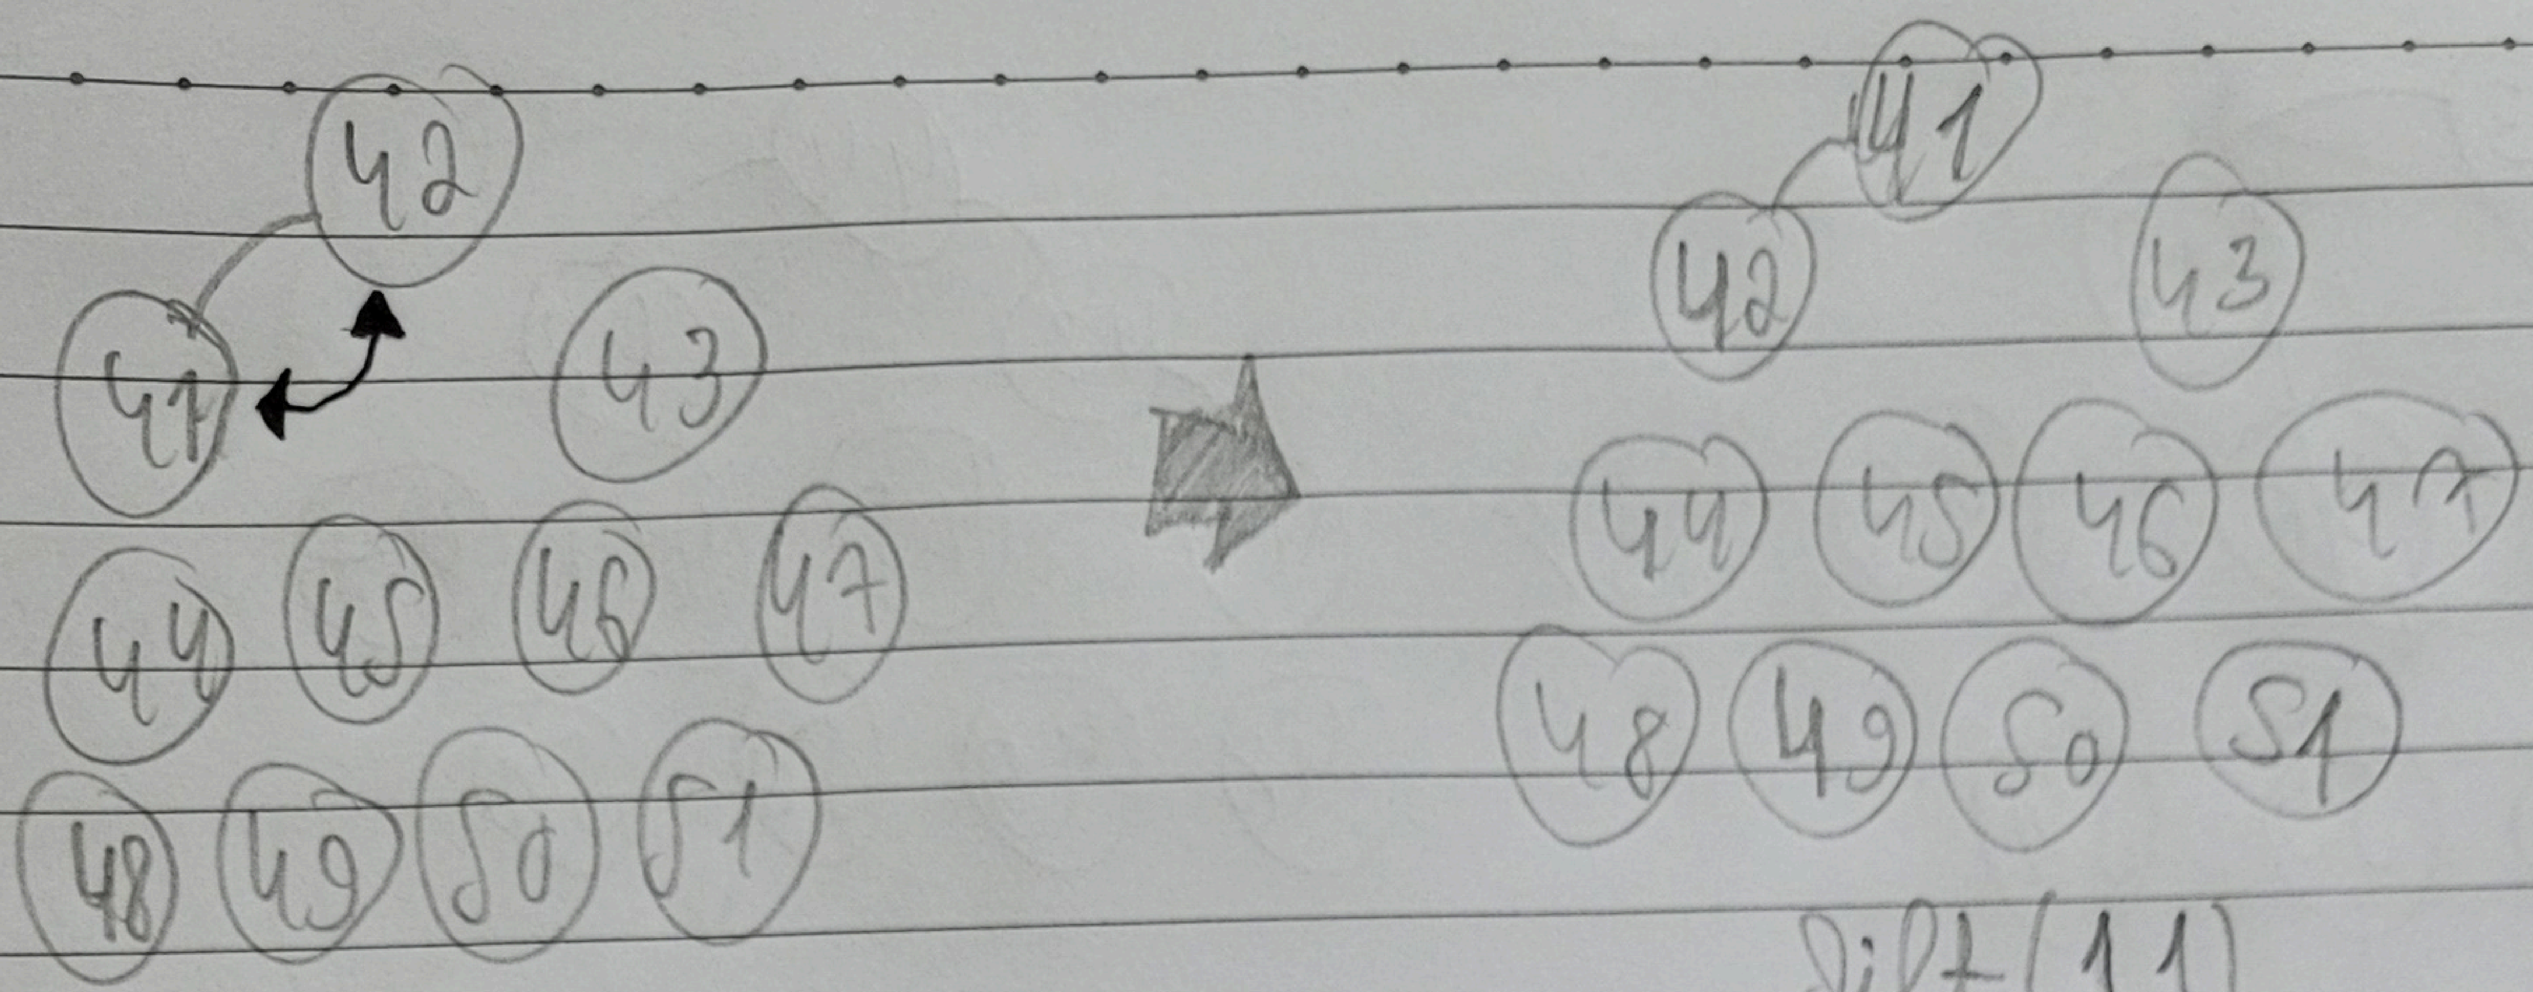


sift(1, 3)

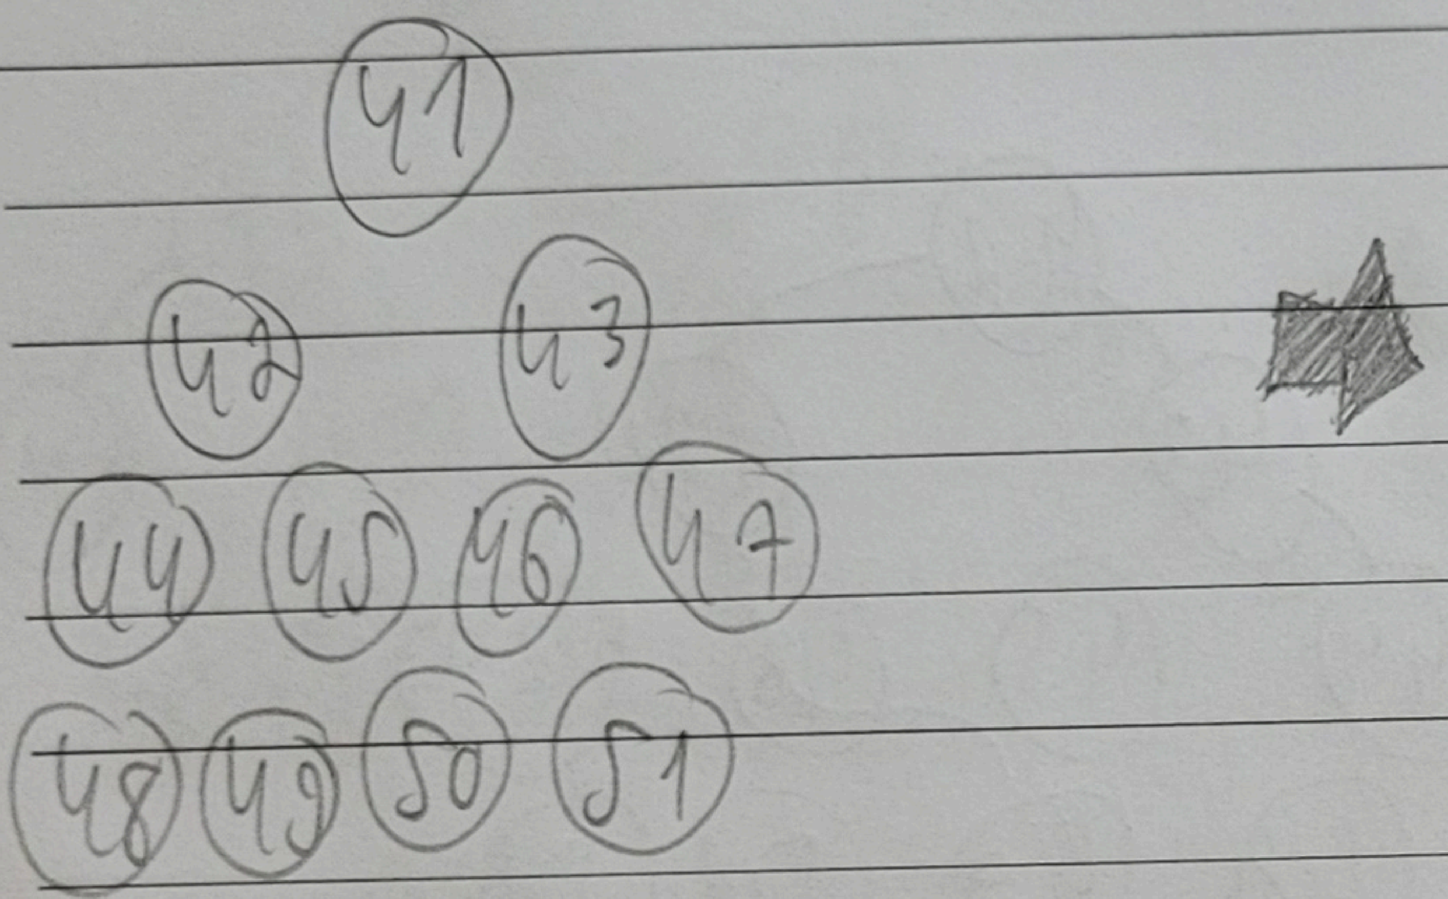




sift(1,2)



Sift(1,1)



Saiu do laço for.
Vetor ordenado.

Vetor = [41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51]

Por fim, o Heapsort é considerado um algoritmo guloso porque, a cada passo, ele escolhe o maior elemento disponível, e o coloca no final do vetor, e esse processo repetido leva à ordenação completa.
